

MC Dennoh Muendo Website - script.js Guide

Create a folder named **js** and inside it create a file named **script.js**.

This JavaScript file will power smooth scrolling, fade-in animations, sticky navigation, and interactive effects for your website.

Suggested starter code:

```
document.querySelectorAll('a[href^="#"]').forEach(link => {  
  link.addEventListener('click', e => { e.preventDefault(); document.querySelector(lin  
k.getAttribute('href')).scrollIntoView({behavior: 'smooth'}); }); });
```

Next we'll create the remaining pages: about.html, gallery.html, videos.html, and contact.html.
